CORE DATASET INSIGHTS:

Audience Demographics: An analysis of content distributions reveals that TV-MA and TV-14 comprise the highest volume of available programming, showing that the platform's core library heavily favors mature audiences and young adults.

Content Categorization: International Movies, Dramas, and Comedies represent the three largest individual content segments by a significant margin across the entire database.

Data Integrity & Preprocessing: Data validation logs detected significant missing values across the Director ,Cast and Country columns. These null entries were programmatically targeted and cleaned during the initial Power Query preprocessing phase to ensure database completeness.
